# Estimating the nonresponse bias through Modeling of Nonresponse Behavior for the MPN

Raymond Hoogendoorn, Eline Scheepers, Olga Huibregtse & Sascha Hoogendoorn - Lanser  
Netherlands Institute for Transport Policy Analysis

Delft, 14 September 2016

# Contents

- Introduction;
- Method;
- Results;
- Discussion;

## Introduction

- Mobility patterns are influenced by many factors (e.g., life events, changes in the use of ICT, etc.);
- Insight into this influence is typically derived from longitudinal panel data;
- Netherlands Mobility Panel;
- Accuracy is influenced by nonresponse bias;
- Initial nonresponse, question or trip diary nonresponse and attrition;

## Introduction<sup>2</sup>

- Nonresponse may, but need not induce a nonresponse bias;
- For example: Suppose that between two waves the government implemented measures to stimulate working from home;
- From the location-based diary one could conclude that the number of trips has decreased;
- However, analyses of attrition show that a substantial number of respondents with a higher education have dropped out;
- Correlation between education level and the number of trips;
- Bias

## Introduction<sup>3</sup>

- Insight is needed into the willingness to participate;
- Research objective: to gain insight into nonresponse bias through modeling of the willingness to participate in a household panel;
- Allows for empirically underpinned insight into and quantification of the different factors that influence nonresponse behavior and the nonresponse bias;
- Insight into how to best model the willingness to participate in a household panel;
- More accurate knowledge on mobility choices and the relationship with various factors, such as life events and developments in ICT use;

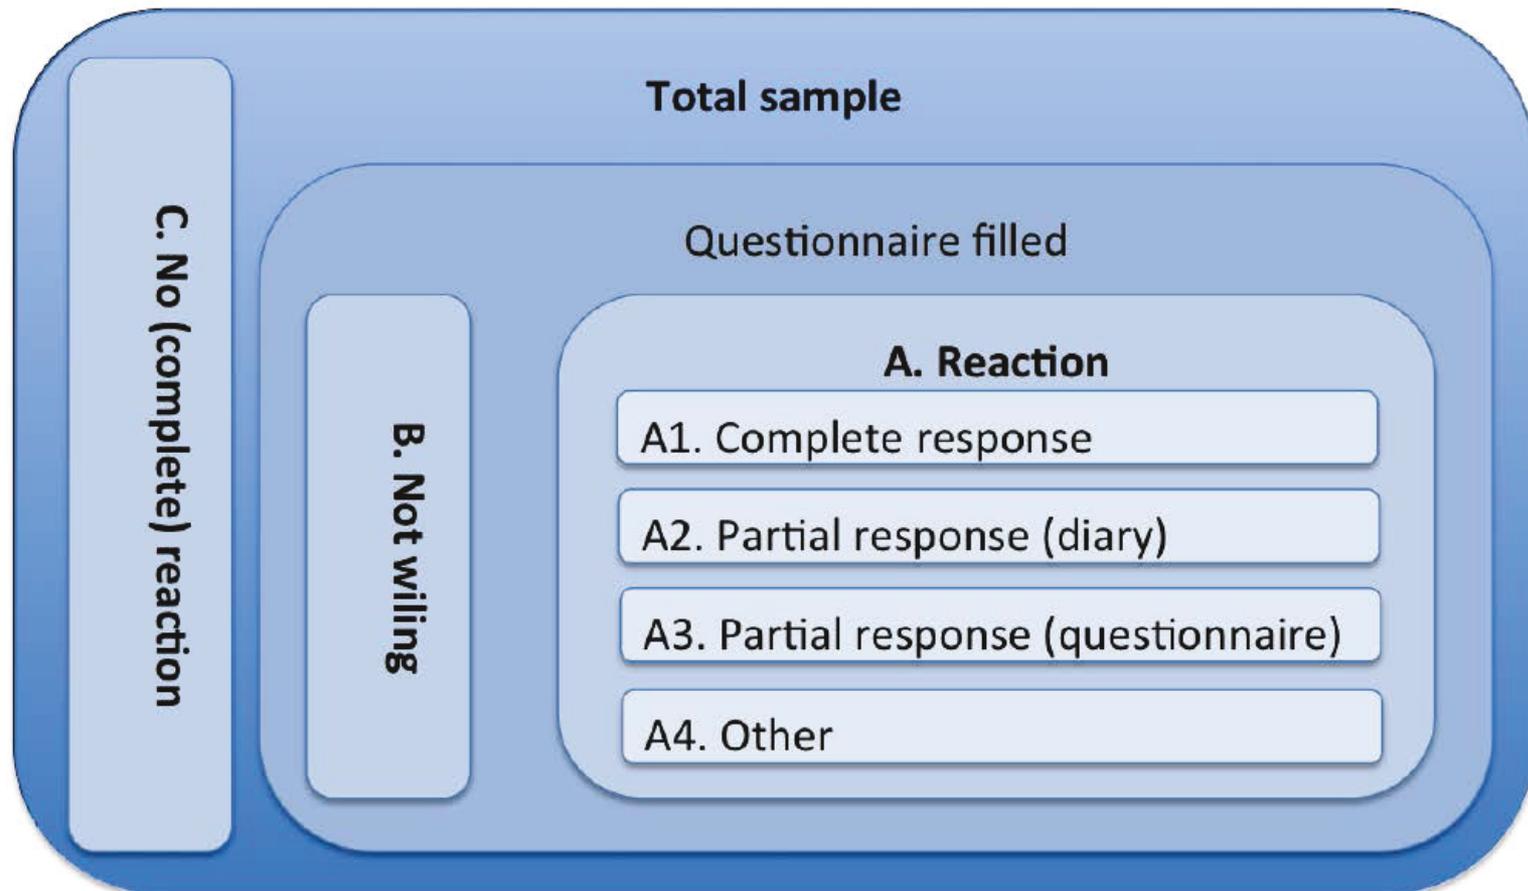

## Method

- Research questions:
  - What is the magnitude of the nonresponse and willingness to participate in the household panel;
  - Is there a significant difference in personal and household characteristics between the individuals who indicated to be willing to participate versus individuals who indicated that they were not willing to participate or do not react at all?
  - How can the willingness to participate in a household panel best be modeled?
  - Is a nonresponse bias present and what is the magnitude of this bias?

## Method<sup>2</sup>

## Method<sup>3</sup>

- Chi-square tests with a confidence level of 95%;
- Ordinal logit model using Biogeme Python;
- Nonresponse bias:  $\text{bias}(\hat{y}_{un}) \approx \bar{\phi}^{-1} \sigma_{\phi} \sigma_y \rho_{\phi,y}$
- “How often do you use your car (either as a driver or as a passenger)?”
- Spearman’s rho;

## Method<sup>4</sup>

- Ordinal logit model:

$$\begin{aligned}\text{logit}(p_1 + p_2 + p_3) &= \log \frac{p_1 + p_2 + p_3}{1 - p_1 - p_2 - p_3} \\ &= \alpha + \beta_1 X_{\text{gen}} + \beta_2 X_{\text{age}} + \beta_3 X_{\text{edu}} + \beta_4 X_{\text{emp}} + \beta_5 X_{\text{Hsit}} + \beta_6 X_{\text{Hsiz}} \\ &\quad + \beta_7 (X_{\text{gen}} X_{\text{age}}) + \beta_8 (X_{\text{gen}} X_{\text{hsit}}) + \beta_8 X_{\text{wav}}\end{aligned}$$

- Main factors and interactions with gender;

## Results

- Magnitude of nonresponse:
  - 44.2% were willing to participate in the study (A);
  - 26.9% were not willing to participate in the study (B);
  - 28.8% did not (fully) respond;
- Relationship with personal and household characteristics:

Characteristic	Value	<i>df</i>	<i>p</i> -value
<b>Gender</b>	<b>387.122</b>	<b>2</b>	<b>.000</b>
<b>Age</b>	<b>437.014</b>	<b>12</b>	<b>.000</b>
<b>Education</b>	<b>89.135</b>	<b>4</b>	<b>.000</b>
<b>Employment status</b>	<b>338.380</b>	<b>10</b>	<b>.000</b>
<b>Household situation</b>	<b>251.528</b>	<b>6</b>	<b>.000</b>
<b>Household size</b>	<b>165.999</b>	<b>10</b>	<b>.000</b>
<b>Wave</b>	<b>118.087</b>	<b>2</b>	<b>.000</b>

## Results<sup>2</sup>

- Parameter values ordinal logit model;
- Interpretation is non straightforward;
- Sign and relative magnitude;
- Several significant variables;
- Examples;

Parameter	Value	Std. error	CI 2.5%	CI 97.5%
<i>Gender</i>				
<b>Male</b>	<b>-.438</b>	<b>.080</b>	<b>-.596</b>	<b>-.280</b>
<i>Age</i>				
18-24	-.127	.085	-.295	.039
<b>25-34</b>	<b>.356</b>	<b>.090</b>	<b>.178</b>	<b>.533</b>
<b>35-44</b>	<b>.507</b>	<b>.104</b>	<b>.302</b>	<b>.713</b>
<b>45-54</b>	<b>.475</b>	<b>.110</b>	<b>.259</b>	<b>.692</b>
<b>55-64</b>	<b>-.075</b>	<b>.112</b>	<b>-.146</b>	<b>-.001</b>
<i>Education</i>				
No - low	.191	.044	.105	.278
<b>Medium</b>	<b>.194</b>	<b>.040</b>	<b>.116</b>	<b>.272</b>
<i>Employment status</i>				
<b>Paid</b>	<b>-.257</b>	<b>.070</b>	<b>-.394</b>	<b>-.119</b>
<b>Disabled</b>	<b>-.352</b>	<b>.108</b>	<b>-.565</b>	<b>-.140</b>
Retired	-.093	.075	-.242	.055
<b>Student</b>	<b>-.317</b>	<b>.073</b>	<b>-.461</b>	<b>-.173</b>
<b>Unemployed</b>	<b>-.350</b>	<b>.103</b>	<b>-.553</b>	<b>-.147</b>
<i>Household situation</i>				
Single	-1.659	1.176	-4.687	.448
<b>With young child 0-13</b>	<b>.326</b>	<b>.075</b>	<b>-.474</b>	<b>-.178</b>
With young child 13-17	-.089	.077	-.241	.061
<i>Household size</i>				
Size 1	1.628	1.179	-.487	4.660
<b>Size 2</b>	<b>-.368</b>	<b>.112</b>	<b>-.588</b>	<b>-.148</b>

Size 4	.006	.102	-.193	.207
Size 5	.023	.110	-.240	.193
<i>Wave</i>				
Wave 2	-.006	.051	-.108	.093
<i>Thresholds</i>				
$\tau_1$	-.851	.134	NA	NA
$\tau_2$	.336	.134	NA	NA

## Results<sup>3</sup>

- Interactions
- Several significant interactions with gender;
- Examples;

Parameter	Value	Std. error	CI 2.5%	CI 97.5%
<i>Gender: Age</i>				
<b>Male: Age 18-24</b>	<b>.554</b>	<b>.095</b>	<b>.367</b>	<b>.745</b>
<b>Male: Age 25-34</b>	<b>-.333</b>	<b>.100</b>	<b>-.531</b>	<b>-.136</b>
<b>Male: Age 35-44</b>	<b>-.781</b>	<b>.116</b>	<b>-1.010</b>	<b>-.553</b>
<b>Male: Age 45-54</b>	<b>-.840</b>	<b>.115</b>	<b>-1.066</b>	<b>-.614</b>
<b>Male: Age 55-64</b>	<b>-.419</b>	<b>.123</b>	<b>-.660</b>	<b>-.177</b>
<i>Gender: Household situation</i>				
<b>Female: Single</b>	<b>-.808</b>	<b>.084</b>	<b>-.973</b>	<b>-.643</b>
<b>Female: With young child 0-13</b>	<b>.335</b>	<b>.098</b>	<b>.143</b>	<b>.527</b>
<b>Female: With young child 13-17</b>	<b>-.011</b>	<b>.108</b>	<b>-.223</b>	<b>.200</b>

## Results<sup>4</sup>

- Estimated probabilities;
- Very close to the observed percentages;
- Observed willingness was 44.2% versus 26.9 and 28.8% for not willing and no reaction;

Willingness	N	Mean	Std	Min	Max
Reaction	14679	.438	.070	.248	.602
Not willing	14769	.269	.011	.225	.281
No reaction	14679	.291	.061	.171	.486

## Results<sup>5</sup>

- Nonrespons bias:
- Recall:  $\text{bias}(\hat{y}_{un}) \approx \bar{\phi}^{-1} \sigma_{\phi} \sigma_y \rho_{\phi,y}$
- Spearman's rho for car uses amounts to .21;
- This means that higher probability of willingness is accompanied by less frequent car use;
- Identification of bias;
- Bias amounts to .033;

## Discussion

- Approximation of nonresponse bias through modeling of willingness to participate;
- Close resemblance of estimated probabilities with observed willingness to participate;
- Ordinal logit model performs quite well;
- Various personal and household characteristics are significantly related to willingness;
- Identification of bias;

## Discussion<sup>2</sup>

- However, only first two waves were included;
- Is a nested logit model better?
- How to develop a correction factor for location based trip diaries?

Questions?
